PhD thesis at TU Wien

- Title *Combinatorics of Lattice Paths and Tree-like Objects*
- Supervisor Bernhard Gittenberger, TU Wien
- Description The thesis is concerned with the enumerative and asymptotic analysis of directed lattice paths and tree-like structures. In the first part, several new models for lattice paths are introduced and some of their characterizing parameters, such as the number of returns to zero, or their average height and final altitude are analyzed. In the second part, enumerative and asymptotic results on compacted binary trees are solved. Such trees are a special class of directed acyclic graphs arising from a compressing method.

Research areas

My main interest lies within (analytic) combinatorics, with an emphasis both on exact and asymptotic results for the enumeration of labeled and unlabeled structures and on probabilistic limit laws for combinatorial parameters. In line with this interest, my main focus areas are lattice paths and tree-like structures, but I am also interested in finding other applications of combinatorial and probabilistic tools.

Lattice paths	New “unconventional” models (e.g. catastrophes, reflection, absorption, etc.), enumeration, limit laws and limiting objects, queueing theory
Trees	Compacted trees, directed acyclic graphs, Pólya trees, limit laws
Probability	Random generation, random walks, limit laws and limiting objects
Number theory	Divisibility by prime numbers, applications of generating functions
